In Table 1, articles with authors from more than one country are listed with the collaborations for the most internationally active countries. In total, there are 221 multinational articles written by 920 authors from 52 countries. About 80% of the authors are from the countries in Table 1. Table 2 traces the citation rates (impact) for the most productive countries through the publication years of the IJBD. Citation counts are cumulative here, so older articles have a greater chance of higher values. Uncitedness is comparably low and ranges from 7%-16%. The h-index for the total articles ranges from 0-27. Table 3 shows, where the citations come from.

Conclusion
The literature percentages of descriptors and age groups were compared to developmental psychology literature in PsychINFO. The most frequent themes in IJBD are over the PsychINFO percentage. Noticeable is a decline in the cognitive field and rises in cross-cultural differences and childhood development. Interdisciplinary connections of the IJBD focus on the broad category of social processes and social issues, educational psychology, and clinical psychology. With about 20% of multinationally authored articles, the IJBD is internationally well linked.

Total citation rates have increased since 1990, and also those comparable to the findings of Schoepflin and Müller-Brettel in time since publication, are considerably higher.
